Hello Team,

Thank you all for our productive meeting from 3:30 pm to 4:00 pm today. Your engagement and ideas are driving this project towards success. As we progress, our next steps involve adding data to our TeslaCarModels and TeslaSales2022 tables and joining them to analyze the combined dataset.

In addition to these tasks, I propose we focus on two specific analyses:

1) Best-Selling Car Model:
To identify our best-selling car model, we can execute an SQL query that aggregates the total quantity of cars sold per model. This will provide us with clear insights into which model is most popular among our customers.

2) Total Revenue Per Model:
Understanding the revenue contribution of each model is crucial for our sales strategy. We can calculate this by multiplying the quantity of each model sold by its sale price, providing us with a total revenue figure for each model.

Both of these actions will offer valuable insights into our sales performance and model popularity. We must execute these queries accurately to inform future strategies and understand our current market standing.

As discussed in our meeting today, once everyone has had the opportunity to post their suggestions for additional actions in their respective second post, we will convene again for a brief meeting. This will be a crucial brainstorming session where we will review all proposed ideas and select the most promising actions to implement. This collaborative approach will ensure we make a well-considered and unified decision that leverages our collective expertise and aligns with our project objectives.
I look forward to our continued progress and this upcoming discussion.

Warm wishes,
Avinash
